TETRAGONOMETRIÆ TABULARIÆ DESCRIPTIO.

CAP. I.

Terminorum Præcipuorum ad tetragonometriam
tabulariam pertinentium notatione &
significatione.

§. 1.

Vocabulum Tetragonometriæ compo-
situm est $\delta\alpha\tau\epsilon\tau\alpha\ \tau\eta\ \pi\tau\epsilon\gamma\gamma\omega\mu\epsilon\tau\tau\alpha\ \kappa\alpha\iota\ \tau\eta\ \mu\epsilon\tau\epsilon\tau\epsilon\iota$; quem-
admodum Geometria compositum est $\delta\alpha\tau\epsilon\ \tau\eta\ \gamma\epsilon\omega\mu\epsilon\tau\tau\alpha$?
 $\tau\eta\ \gamma\epsilon\omega\mu\epsilon\tau\tau\alpha\ \kappa\alpha\iota\ \tau\eta\ \mu\epsilon\tau\epsilon\tau\epsilon\iota$, aded, ut sicut hoc si-
gnificat, id quod versatur circa terræ men-
surationem, ita etiam illud significet id, quod versatur cir-
ca mensurationem ejus, quod quadrangulare est.

§. 2. Ejus verò, quod quadrangulare ($\pi\tau\epsilon\gamma\gamma\omega\mu\epsilon\tau\tau\alpha$) est, *Quorū τὰ πτεγγωμεττα species?*
quinque sunt species apud Geometras:

- (1) Quadratum, quod & æquilaterum & rectangu-
lum est; *Encl. def. 29. I. vid. Fig. subjeet. a. b. c. d.* *Quadratum quid?*

(2) Rhom-

CAP. I.

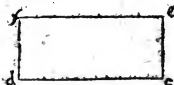

Rhombus
quid?

- (2) Rhombus, qui æquilatera quidem figura est, sed non rectangula. *Eucl. def. 31. I.* vid. Fig. subject. b. c. d. e.

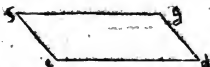

Parallelo-
grammum
quid?

- (3) Parallelogrammum oblongum rectangulum figura rectangula quidem est, sed non æquilatera; Dicitur communiter parallelogrammum κατὰ ἑξῆς & Synechdochicè. *Eucl. def. 30. I.* vid. Figuram subjectam. c. d. e. f.

Rhomboides
quid?

quid?

- (5) Trapezium est figura qualiscunque quadrangula laris à prioribus speciebus diversa, *Eucl. def. 33. I.* vid. subject. Fig. e. f. g. h. vel f. g. h. i.

§. 3. Quid

§. 3. Quia itaqve tabulæ tetragonometriæ nostræ nul-
los alios numeros continent, quàm qui immediatè repræ-
sentant vel saltem repræsentare possunt primam & secun-
dam Tetragonicarum figurarum species, atqve mediantibus
hisce duabus speciebus etiam exprimere valent reliquas
tres species, ut & quasvis figuras planas numero effabiles, &
beneficiò Tetragonometriæ nostræ tabulariæ determina-
biles, ut suo dicetur locò, meritò Tetragonometria tabula-
ria audit hæc nostra doctrina.

§. 4. Hinc definitionem ponimus talem: Tetragono-
metria Tabularia est doctrina, quæ per numeros planos in ta-
bularum redactos & quadrangulares figuras planas quasvis re-
præsentare valentes, quantitates in universali Mathesi nu-
mero determinantur, & vulgaris calculus abbreviatur.

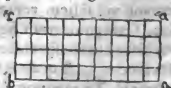

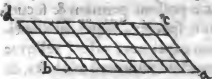

§. 5. Planus numerus dicitur, eò quòd possit repræ-
sentare figuram planam.

§. 6. Cum enim duo numeri sese multiplicantes ali-
quem fecerint, qui factus erit planus appellabitur; qui verò
numeri sese mutuò multiplicarint, latera illius dicentur: sic
ait *Eucl. def. 16. VII.* e.g. duo numeri 4. & 9. multiplicantes
sese faciunt numerum 36. quare is ipse planus est, iidem,
enim numeri 4. & 9. si in subiecta figura a. b. c. d. tanquam

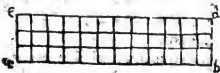

puncta

puncta æqualiter distantia juxta se invicem in directum ponantur, & tanquam duo figura Latera a. b. & b. c. sibi invicem jungantur, reliquis duobus lateribus c. d. & d. a. figuram quadrangularem simul comprehendentibus & totidem puncta habentibus, tota repræsentabitur figura plana a. b. c. d. 36 complectens puncta, cujus unum latus a. d. vel b. c. habet 4, alterum verò latus a. b. vel c. d. 9 habet puncta. Similiter si iidem numeri tanquam particule æquales duarum linearum æstimentur, quæ tanquam duo figura latera

a. b. & b. c. sibi invicem jungantur, reliquis duobus lateribus c. d. & d. a. figuram quadrangularem simul comprehendentibus & totidem particulas æquales habentibus, tota figura plana a. b. c. d. comprehendet 36 figuras minores planas æquales inter se, sive sint quadrata sive Rhombi. Idem judicium esto de numeris 3. & 12. in subjecta figura b. c. d. e. & in omnibus aliis.

Quadratus
numerus.

§. 7. Quando verò illi duo numeri sese multiplicantes, sunt æquales ut 4. & 4. 6. & 6. 7. & 7. 10. & 10. 96. & 96. &c. & aliquem fecerint, qui factus erit, planus quidem etiam est, sed in specie quadratus dicitur.

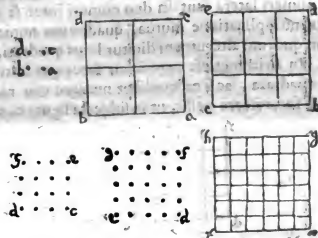

Quadratus
numerus
quid?

§. 8. Quadratus numerus ab Eucl. def. 18. VII. definitur, quòd sit ille, qui æqualiter æqualis est, vel, qui sub duobus æqualibus numeris continetur.

§. 9. Cla-

§. 9. Clavius hanc definitionem sic explicat: *Æqualiter æqualis est numerus, qui secundum unitates suas in longum & latum dispositas refert parallelogrammum rectangulum, cujus longitudo latitudini est æqualis, ita ut omnia latera sint æqualia; Vel qui ex multiplicatione mutua duorum numerorum æqualium procreatur, atque adeo sub illis continetur.* Hujusmodi quadratus numerus est 4, contentus sub duobus numeris æqualibus, 2. & 2. ex quorum multiplicatione iste genitus est, similiter quadratus numerus est 9, contentus sub duobus numeris æqualibus 3. & 3. porro quadrati sunt 16, & 25, & 36. &c. qui continentur sub numeris 4, & 4, 5, & 5, 6, & 6. &c. ut patet ex subjectis figuris.

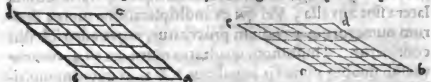

*Æqualiter
æquale
quid?*

§. 10. Dicitur quidem quadratus numerus *figura quadrata*, seu præcipua seu potiori, quam comprehendit, sed idè non statim figura Rhomborum excluditur, cum idem numerus quadratus Rhombos etiam infinitæ multitudinis quoad planitiem minores semper atque minores representare possit, quamvis latera Rhomborum sint semper

*Quadratus
numerus
unde dica-
tur?*

eadem & æqualia, quapropter prædicta Euclidis definitio generaliter concepta, & Rhombis etiam conveniens, malè à Clavio d. l. ad parallelogrammum rectangulum tantum restringitur; ut patet ex subjectis figuris, in quibus quodli-

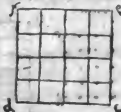

bet latus habet 6 particulas æquales & quolibet figura 36 Rhombos minores, sed æquales inter se.

Latus quadrati quid?

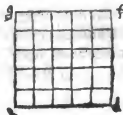

§. 11. Quemadmodum in §. 6to. numeri qui sese mutuo multiplicarint, latera plani numeri dicuntur, ita etiam quadrati numeri latera sunt isti duo numeri inter se æquales, qui ex multiplicatione mutua, quadratum numerum procreant, quorum alterutrum dicitur latus quadrati.

Radix quadrati quid?

§. 12. In Arithmetice verò idem latus quadrati dicitur radix quadrata, ac si ex quolibet numero ceu radice, quadratum succrescere possit, ut in subjecta figura c. d. e. f.

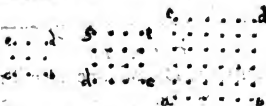

latus c. d. vel latus d. f. vel latus f. e. vel latus c. e. dicitur radix quadrata. Et in figura d. e. f. g. latus d. f. vel g. f. vel

g. e.

§. 12. dicitur latus quadrati, idem concipe de reliquis tribus figuris, & omnibus aliis.

§. 13. Quadrato verò numero dato sive proposito, vice versa etiam in ejus radicem ab Arithmetice inquiri eademque inveniri solet, quæ inventio dicitur extractio radicis quadrata, quod ipsum cum ad primarium tabularum Tetragonometria nostra negotium pertineat, terminum radicis quadrata retineri à nobis, fas est.

*Extractio
radicis
quadrata
quid?*

§. 14. Tabula enim tetragonometria nostra, nullos alios repræsentant numeros, nisi Radices, Earundemque quadrata; Et quidem omnes & singulas radices inter unitatem 1. & numerum 100000. comprehensas sive dabiles & integro numero effabiles, hoc est fracto aliquo numero minime affectos; Omnia verò & singula itidem quadrata inter unitatem 1. & numerum 10000000000. sive decem millionum millionum comprehensa, & exactam radicem absque fractione habentia.

*Numeri in
tabulis
quales?*

§. 15. Caterum quot in tabulis sunt quadrata, tot etiam sunt Triangula æquilatera, quorum latera cuilibet radii accommodata, tot efficiunt triangula æquilatera minora, quot radix efficit quadrata, e. g. in subjecta Figura B. La-

tus trianguli est 6 partium & reperiuntur 36 triangula equilatera, quia radicis 6 quadratum etiam est 36, idem concipe de aliis omnibus.

De Tabularum Dispositione, utendi modo
& Compendio.

§. 1.

Radici millenarii & centenarii numeri, ubi collocati?

Centenarii & millenarii radicum numeri dispositi sunt in fronte seu facie sive summitate, ubi peculiaribus cellulis oblongis inclusi & ab inferioribus numeris non minus etiam, à se invicem interjecta lineâ, distincti & separati sunt. Sic videbis, quod in prima pagina in fronte, sint positi, 0. 100. 200. 300. 400. 500. 600. 700. & sic porro in sequentibus paginis per centenarios omnes crescentes usque ad 99900.

Radici denarii & simplices numeri ubi collocati & quomodo distincti?

§. 2. Centenariis autem & millenariis adhaerentes intra centum numeri in margine sive latere ad sinistram, reperiuntur, & à numeris iuxta se positis duabus lineis distincti sunt, feliciores etiam inventionis gratiâ, quini numeri unam habent interjectam lineam & quidem semper post figuras 0. vel 5. seu numeros vel simplices vel cum reliquis numerorum figuris quibuslibet denariis scilicet compositos, sic e. g. post 20. vel 80. vel 40. erit subiecta lineam, item post 15. vel 35. &c.

Quadrati numeri ubi & quomodo dispositi?

§. 3. Reliqui omnes in tabulis numeri sunt numeri quadrati, singulis suis radicibus correspondentes & sursum ad suos Radicis millenarios atque centenarios in fronte, ad sinistram verò Latus ad Radicis numeros simplices vel etiam denarios respicientes.

§. 4. Quo-

§. 4. Quomodo itaque singulae radices ab 1. usque ad 100000. in tabulis quarantur, per se patet; primò enim ad millenarios deinde ad centenarios in fronte; ad denarios verò vel simplices, nimirum qui sunt infra centum ad latus sinistrum respiciendum est. E. g. quærenda est Radix 3603; in fronte inuenies primò 3600 & in latere inuenies 3. hoc fere modò: $\|3600$: Item quærenda est Radix 36523. evolvendo

& revolviendo, tandem inuenies in fronte 36500 & in latere 23. intellige: $\|36500$: Sic quærenda in tabulis est radix 20300, in fronte videbis suo locò 20300 & in latere 0. ita nimirum: $\|20300$ & sic de cæteris.

§. 5. Ad faciliorem quadratorum Evolutionem sex potestremæ numerorum quadratorum figuræ semper sunt expressæ, antecedentes verò cum pluribus numeris quadratis communes sint, non nisi semel expressæ sunt, ita tamen, ut in proximè sequentibus etiam tanquam expressæ subintelligantur, usque dum ad alios præpositos numeros expressos perueniatur.

§. 6. Hinc quilibet quadratus numerus facilè evolvitur, abscindendo nimirum per interpositum punctum vel comma, 6 posteriores ad dextram numerorum figuras; si hoc fieri possit, hoc casu enim aut nulla numerorum figura, aut unica, aut duæ aut tres, aut quatuor supersunt, quibus singulis casibus primò ferè tabularum intuitu inuenies, ubi similiter vel nulla vel unica, vel duæ vel tres vel quatuor numerorum figuræ prædictis 6 ultimis sint antepositæ; Non minus etiam in altero casu, idem evenit, quò sex figuræ abscindi non possunt, quando nimirum propositus vel datus numerus quadratus pauciores sex figuris habet; facillimè

*Radices

Cur in tabulis quadratorum numeri non nisi in sex potestremis figuris continuentur?

Quadrati numeri, quomodo in tabulis quarantur? (Primò) abscindendo sex potestremas figuras.

enim reperitur tabularum locus, ubi vel ex unica vel ex duabus vel ex tribus, vel quatuor vel quinque numerorum figuris quadrati consent numeri.

*(Secundo)

§. 7. Facta tali abscissione initiales ad sinistram numeri omnium primò considerandi, & in tabulis querendi sunt successivè de proximo ad proximum pergendo, usque dum numerus in tabulis cum dato seu proposito aut exactè correspondeat in numeris exactè quadratis, aut saltem omnium minorum maximus, i. e. Dato numero proximè minor in numeris exactè radice carentibus, reperiat. E. g. querendus in tabulis est numerus quadratus 347912256; abscissis 6 ultimis, remanent priores 4 nempe 3479, hunc numerum, quero in isto tabularum loco, ubi continuè 4 sunt anteposita figura & quidem ubi numerus initialis est 3. postmodum, facillimè invenitur, ubi sequens sit 4 & porro ubi sit 7 & ubi 9. Hisce 4 inventis restat, ut abscissa figuræ conferantur cum 6 figuris in tabulis sive cum antecedentibus 4 conjunctis sive proximè subjectis, in quibus omnes 6 nempe 12256 exactè in tabulis reperiuntur, & quidem conjunctim cum, suis 4 antecedentibus.

*Exemplum
Secundum.*

Item queratur e. g. 832, 841891. abscissis 6. remanent 832, quem numerum in tabulis invenies, habentem 6 adjunctas figuras nempe 034625. & descendendo, statim pervenies ad abscissum exactè, nimirum 841881.

*Exemplum
Tertium.*

Porro queratur quadratus numerus 40500496. abscissis 6. pluribus communis 40, inter alios etiam exactè sub se habet, 508496, quod non potest non statim inveniri, cum hic etiam initiales 50 celeri cursu ad suum competentem locum deducant querentem.

*Exemplum
Quartum.*

Tandem e. gr. queratur numerus quadratus 51076, hinc difficultate ostendens tabulæ, ubinam locorum 5 tantum, sint

sint figuræ & ubi earundem initiales sint 71, ubi totus quatuor similiter innoscit.

Unicum saltem exemplum proponi numerorum radicem quadratam exactè non habentium necessitas ordinis exigere videtur: Quærat^{ur} numerus 7369500176, abscissis 6 ultimis in tabulis dantur antecedentes 7369. communes cum adjecto eidem & quinque aliis subjectis numeris quadratis inter quos unicus 364025 dato 500176 proximè minor est & dati loco assumendus; in finem determinanda fractionis Radici quadratæ adhzrentis; ut infra explicabitur.

§. 8. Dispositis sic & Radicibus & quadratis singula radices respiciunt ad sua quadrata & vice versa, quadrata ad suas radices; Nempè:

§. 9. Si detur aliqua radix, istius quadratum deprehenditur in communi concursu, quando in tabulis à millenariis & centenariis Radicis datæ numeris descenditur usque dum aliquis numerus quadratus sit è regione numerorum Radicis infra centum in latere. Vel brevius: A fronte in eadem columna descende tam diu usque dum pervenias ad numerum qui è regione positus est illi in latere. E. g. Radicis 236 quadratum est 55696. quia in tabulis, tam diu à centenariis descendimus usque dum 55696 fuerit è regione 36. sequenti ferè gaudet figura.

$$\begin{array}{r} 200 \\ 36 \overline{) 55696} \end{array}$$

Similiter quadratum radices 1200 nempè: 1440000. eodem modò quæritur; in tabulis enim videbis:

$$\begin{array}{r} 1200 \\ 0 \overline{) 1440000} \end{array}$$

Quadratum radices 25962 similiter invenietur & erit 674,025444, nimirum in tabulis videbis

§. II. Quoniam verò inexercitatis difficile viderur esse, *quotuplum* conjecturare quotuplum divisoris subijci debeat, quod ipsum quidem in arithmetica nostra noviter adornata, atque typis destinata facillimè addiscitur, ut interea temporis parum saltem huic difficultati consulatur, subijciam licet Exemplum Extractionis Radicis, cujus quadratum *divisorum* *quæ ratione* *compendiosè* *inveniantur* *&* *explicatur* *per exemplum.* 389464390961477961 non minus ac precedentia, duo Exempla per radicem datam inventum fuit in Exemplo tertio, §. 3. hujus capituli. Ex quo unico exemplo solo intuitu intelligi potest, quod salvis prioribus operationibus, sub quotiente luccessivè accrevit ejusdem duplum, nempe divisor, similiter sub divisoire, ipsius divisoris duplum, & postea sub hoc divisoris duplo rursus hujus ipsius dupli

Ergo ipsum duplum, cujus initialis 7. est proximè minor, qui subtrahi potest. Nonus quotiens est 1. cum dupli initiales sint 78. superioris verò in subtractione facienda initiales sunt 74. Ergo proximè minus erit simplum. Decimus tandem quotiens est 9. cum octupli & simpli initiales simul faciant 34. & initiales superioris 35. & tandem propter sequentes in octuplo & simplo superiori in totum fere sit equalis; Hæc perpicua esse nullus dubito, sed etiam quadratum simul sub-

est illò à quo subtractio fieri debet, quod statim initiales numeri in superiore quidem subtractionis 33. in inferiore vel subtrahendo verò 37. indicant, cum noncuplum non poterit subtrahi, componi enim debuisset ex octuplo & simplo, & initiales fuissent 34. qui subtrahi non potuissent à 33; Septimus quotiens est 5. hoc ipsum statim significant initiales quadrupli 15. nam si hos addas dupli initiali 7. habebis 22. numerum majorem initialibus in superiore à quo subtractio fieri debet 30. si verò addas ad initialem simpli 3. habebis 28. qui numerus propter sequentes fit 10. minores nempe 20. est quadruplum & simplū, si componantur faciunt quintuplum, quod facile in schemate, cum sibi invicem supposita sint, fieri per additionem potest immediate summam in competentem locum transferendo: Octavus quotiens est 2. statim enim simpli & dupli initiales efficiunt 10. sed initialis superioris in subtractione facienda est 8. Ergo ipsum duplum, cujus initialis 7. est proximè minor, qui subtrahi potest. Nonus quotiens est 2. cum dupli initiales sint 78. superioris verò in subtractione facienda initiales sunt 74. Ergo proximè minus erit simplum. Decimus tandem quotiens est 9. cum octupli & simpli initiales simul faciant 34. & initiales superioris 35. & tandem propter sequentes in octuplo & simplo superiori in totum ferè sit equalis; Hæc perpicua esse nullus dubito, sed etiam quadratum simul sub-

*In divisione

§. 13. Utsum etiam circa divisionem tabulæ tetragonometricæ aliquid afferant utilitatis vel compendii jam videndum, & sciendum quidem, sicut in vulgari divisione quotientis haud sine anxia inquisitione an procedat, nec ne? singularium invenitur, sic etiam quidem per tabulas numeri in quotiente non simul omnes sed bini & bini inveniuntur, sed ultra apparent simplici additionis & subtractionis beneficio, singulari & utilissimo & suavissimo compendio, ut sequitur.

*Diviso per

§. 14. In divisione nostra per tabulas tetragonicas duo sunt distinguendi Casus; Aut enim divisor minor est quàm 99900. aut major illò numero 99900. Si divisor minor sit, rursus subdistingui debet; aut enim divisor habet quinque numeros aut hacet pauciores.

*Si pauciores

§. 15. Hòc casu divisoni adjiciendæ sunt tot Cyphræ nullitatis, quot divisor quinque numeris habet pauciores; ex. gr. si divisor sit 339. adjiciendæ sunt duæ nullitatis Cyphræ, ut fiant quinque numeri, hòc modò: 33900. similiter, si divisor sit 9. adjiciendæ sunt quatuor Cyphræ hòc modò, 90000. & sic, si divisor sit 2596. erit adjicienda una Cyphra, ut fiat divisor = 25960. &c. Quotquot verò in quolibet Exemplo divisoni adjectæ fuerint Cyphræ, tot etiam sunt adjiciendæ Cyphræ dividendo; Quo factò hic casus adæquatus erit illi, quò in divisonore sunt quinque numeri.

*Si divisoris

§. 16. Adæquatis hñce duobus casibus & in unum redactis casum, rursus aut divisoris initiales ad sinistram sunt minores aut majores initialibus numeris dividendi; Hòc casu in dividendo numero à sinistra versus dextram septem sunt per interjectam lineolam abscindendi numeri, illò verò casu tantum sex, sicut etiam in vulgari arithmetica divisor, cujus initiales sunt minores initialibus dividendi, tot à divi-

dividendo unius quotientis gratia absorbet numeros, quoti-

 meri simul procedunt.

 præcise futuri sint, istislem quare in tabulis quadratum pro-

 sunt ante punctum vel comma, & duobus sequentibus atque
 hic duo sunt distinguendi casus; Aut enim duo post punctum

 differunt solum unitate à duobus post punctum vel comma
 numeris in quadrato dictum proximè minus in tabulis im-
 mediatè sequenti aut differunt ab iisdem majori quovis nu-

 in tabulis sunt in margine, & ab hisce duobus ultimis exci-

Ex hac ipsa demonstratione fluit divisionis nostræ sequens regula brevissima: Dividendi duplo in tot numeris quot ad eruendos unum vel duos simul quotientes sufficiunt addatur quadratum divisoris & insuper quadratum futuri quotientis in uno vel duobus numeris. §. 28. Positis his omnibus, nihil ominis restant duo casus, quibus divisio per tabulas secundum præcedentem methodum peragi nequit, quando nimirum divisor, vel est major quidem quam 99900. minor vero quam 100000. vel est major quidem quam 100000. quinque vero ipsius initiales ad sinistram sunt majores quam 99900. & minores quam 100000. facilis vero est horum duorum casuum solutio; si nempe in utroque casu non quinque initiales seu divisor accipiantur, sed tantummodò quatuor, reliquis omnibus manentibus, ut in præcedentibus dictum est.

§. 29. Quemadmodum jam ultro fatemur, divisionem per tabulas quadratorum, in casibus illis, in quibus divisor major est quam 99900. nihil aut parum compendii afferre rei Mathematicæ, præprimis cum à me inventa sit alia divisionis ratio, quæ & huic per tabulas & aliis quibuslibet palmarium facile præripere potest, duplicatò nimirum & quintuplicatò per dimidiationem solum divisore, ad quosvis quotientes simplici additione & subtractione inveniendos, ita demonstrationem ejusmodi divisioni subicere haud necessarium esse existimaui, sperans hic eum Cartesio in fine suæ Geometriæ, à posteris mihi gratias habitum iri, non solum pro iis, quæ in hoc capite tum utilitatis, tum curiositatis gratiâ explicui, sed etiam pro hac demonstratione, quam consulto omisi, quo ipsis voluptatem illam inveniendi relinquerem.

CAP. VI.

De Admirando Tabularum usu in numeris figuratis, præter quadratum, reliquis, Trigonio, Pentagonio, Hexagonio &c. in infinitum.

§. I.

CUM ex quatuor aut quinque solummodò operationibus *Continuationis ratio.* tota constet Arithmetica, quæ sunt Additio, Subtractio, Multiplicatio, Divisio & Radicum Extractio, adeò, ut Cartesius non veritus sit hos ipsos Arithmeticos terminos, in suam Geometriam introducere, additio verò & subtractio sint & simplicioris & communioris praxeos, econtra Multiplicatio, divisio & radicum extractio altioris indaginis, hæc verò, quomodo per tabulas expendantur, in præcedentibus plenissimè & ostensa & demonstrata à nobis sint; Legitimationem tetragonometriæ nostræ tabulariæ in generalioribus & universali Mathesi sufficientissimam esse, firmiter mihi persuasum est, in super etiam speciatim aliqua attingere haud abs re esse existimò, attingere dico, non plenè absolvere, multò minus hic demonstrare, quàmvis demonstrabilia sint omnia, id quod Fata huic opusculo præter intentionem ab initio meam denegarunt, curabo ramen universalem Mathesin hisce tabulis plenissimè applicari, & demonstrari; si DEUS Vitam largiatur & operam meam publico gratam esse sentire potuero, primò verò illa proponam, quæ circa numeros in universali Mathesi inter alia multa proponi solent & ad Mathesis universalis partem Arithmeticam potissimum spectant.

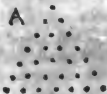

§. 2. In Arithmeticeis ex natura ipsa numerorum, vel *Progressio Arithmetica* potius ex naturali ipsorum progressionem, se nobis offert omnium

§. 3. Si ab unitate incipiendo ponamus naturaliter & secundum ordinem numeros, continuè unitate solummodò crescentes, & tandem, ubicunque libuerit in ultimo aliquo subsistamus, atq; summam omnium colligamus, istam summam efficere numerum trigonium & in Triangulum æquilaterum æqualibus continuò distantis exactè redigibilem. E. g. si subsistamus in numero, 7. & summam omnium, 7. 6. 5. 4. 3. 2. & 1. colligamus, erit illa, 28 sed hic numerus dicitur esse triangularis, quia singulæ istius numeri unitates, ceu puncta, in triangulum æquilaterum exactè sunt redigibiles, ita ut perpetuò uniformiter à se invicem distent, ut patet ex appositis Figuris A. & B.

§. 4. Datò itaque quovis numero ultimò in progressionem ejusmodi arithmetica, vel etiam numero terminorum, ejusdem triangularis numerus, seu summa omnium terminorum invenitur per Regulam in Arithmeticis communem; quòd nempe ille numerus, unitate auctus debeat multiplicari cum dimidio numero terminorum, vel si hic numerus sit impar, ut dimidium non nisi in fracto numero haberi possit, quòd dimidium ultimi numeri unitate aucti multiplicari debeat, cum numero terminorum; Sic in præcedenti Exemplo, ultimus erat 7. idemque unitate auctus 8. cujus

tujus dimidium 4. multiplicans numerum terminorum 7. (sunt enim in hac progressionem septem termini) procreat triangularem dictum 28. Pari ratione invenies, si numerus ultimus sit 48734. ejusdem numerum triangularem seu summam omnium terminorum esse, 1187525745. multiplicando nimirum ultimum terminum unitate auctum 48734. cum dimidio numero terminorum 24367. ut tentanti constabit.

§. 5. Multò facilior & compendiosior hic est operatio *Facilior inventio per tabulas.* per tabulas, in quibus solummodò evolvitur quadratum ultimi termini eidemque additur, sua radix i.e. ipse ultimus terminus, eritque tunc dimidia summa, quæsitus numerus triangularis, seu summa omnium terminorum; sic vides quòd ultimi termini 7. quadratum sit 49. & horum duorum summa 56. dimidia verò 28. numerus triangularis; Pari modo quadratum ultimi termini 48734. est 2375.002756. & horum summa 2375051490. quare dimidia 1187525745. erit quæsitus triangularis, seu summa omnium terminorum.

§. 6. Elegantissimè sic singulæ radices in tabulis non solum quadratos, sed etiam triangulares suos numeros determinant.

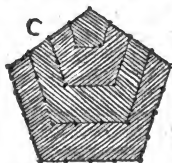

§. 7. Econtra ex quolibet numero triangulari vel summa progressionis, radix triangularis, vel ultimus terminus vel etiam numerus terminorum extrahitur, si ipsius octuplum unitate auctum, seu quadratum, in tabulis quærratur, ejusdemque radicis unitate diminutæ dimidium; sic numeri triangularis 28. octuplum unitate auctum est 225. cujus radix quadrata, unitate diminuta est 14. cujus dimidium 7. erit radix triangularis quæsitæ;

§. 8. Si porro ab unitate incipiendo ponamus numeros binariò crescentes & subsistamus in aliquo seu ultimò atque colligamus summam omnium terminorum, repræsentabitur.

tabit illa ipsa numerum quadratum, de quo, cum suprâ, Capite tertio ex professo actum sit, ad sequentes similes pergendum hic est.

*Numerus

§. 9. Si itaque porrò ab unitate incipiendo, ponamus numeros ternariò crescentes, & subsistamus in aliquo ceu ultimo, atque colligamus summam omnium terminorum, repræsentabit illa ipsa numerum pentagonium, seu quinquangularem; quia in apposita figura pentagonia regulari cernere licet, quòd ad punctum verticale, ceu unitatem, primò accedant, ad minimum quatuor puncta, ad formandum pentagonium primum regulare, deinde porrò accedunt tribus additis 7. puncta, quæ cum aliis tribus punctis,

quæ fuerunt in pentagonio priori in æquali distantia, formant secundum pentagonium, similiter porrò accedunt tribus additis 10. puncta, quæ cum aliis 5. punctis, quæ fuerunt in secundo pentagonio, formant, in æquali distantia tertium, pentagonium, non minus porrò accedunt tribus additis 13. puncta,

quæ cum aliis 7. punctis, quæ fuerunt in tertio pentagonio formant in æquali distantia quartum pentagonium; &c. Omnia vero puncta in tota figura C. vel alia quacunque majori in unam summam collecta efficere dicuntur, numerum pentagonium, cujus radix pentagonia est latus pentagonii maximi, ultimus vero terminus progressionis, juxta differentiam 3. repræsentat tria maximi pentagonii latera.

viori via inveniri non potest, quàm, quòd tertia pars ultimi termini binariò aucti, multiplicari debeat, cum dimidia parte ejusdem quidem ultimi termini sed unitate solum aucti, si modo ultimus terminus sit numerus impar: sic ex. gr. ultimus terminus sit 13. & binariò auctus 15. hujusque tertia pars 5. multiplicata cum dimidia parte ultimi termini unitate aucti, nempe 7. producit summam omnium terminorum vel numerum pentagonium, 35. Si verò ultimus terminus sit numerus par, dimidius numerus terminorum, multiplicari debet, cum ultimo, unitate aucto; Sic ex. gr. ultimus numerus sit 65638. & binariò auctus 65640. cujus tertia pars 21880. hujusque dimidium 10940. multiplicatum cum ultimo termino, unitate aucto, 65639. producit summam omnium terminorum, vel numerum pentagonium, 718090660.

§. 11. Multò brevius hæc omnia fiunt per tabulas, in quibus solummodo querendum est quadratum ultimi termini, ejusdemque binariò aucti tertia pars, est addenda ipsius radici ceu ultimo termino, summæ dimidium, erit summa omnium terminorum seu numerus pentagonius. Sic ex. gr. ultimi termini 13. quadratum est 169. cui si addatur binarius 2. erit summa 171. cujus tertia pars 57. addita radici 13. facit summam 70. cujus dimidium 35. est ut antea, summa omnium terminorum, seu numerus Pentagonius: Similiter ultimi termini 65638. quadratum binariò auctum est 4308347046. cujus tertia pars 1436115682. addita radici 65638. facit summam 1436181320. cujus dimidium 718090660. est, ut antea summa omnium terminorum, seu numerus Pentagonius.

§. 15. Rursus per tabulas hic accrescit egregium compendium, nam datâ pentagonii numeri radice, ipse numerus pentagonius statim invenitur, quærendo radicis quadratum, eidemque addendo ejusdem quadrati dimidium, neglectâ fractione ex imparitate accedente, atque ab hac summa radicis dimidium subtrahendo, rursus neglectâ imparitatis fractione. Sic ex. gr. radicis 5. quadratum est 25. huic si addas ejusdem dimidium 12. absque fractione, summa erit 37. à qua si subtrahas dimidium radicis 2. absque fractione, restabit 35. quæsitus numerus pentagonius. §. 27. Missis aliis in progressionem arithmetica quàm plurimis, pauca quædam circa progressionem geometricam proponam, ubi statim Tabulæ quadratorum vel ob hunc solum usum proportionalium geometricorum, maximi sunt momenti, nihil enim ferè in tota Mathesi crebrius occurrit, quàm inventio medii proportionalis, quod ipsum calculo aliter determinari non potest, nisi ut data extrema secum multiplicentur, & ex producto radix quadrata extrahatur, quàm facilis autem sit extractio radices per tabulas superius capite quarto abundè demonstratum est. Ex.gr. inter 4. & 9.

medius

medius proportionalis est 6. quia quater novem sunt 36. cuius radix quadrata 6. est quæsitus medius proportionalis; Similiter inter duos numeros 39601. & 29929. medius proportionalis est 34427. ita, ut se habeat 39601. ad 34427. sicut se habet 34427. ad 29929. vel vice versâ, 29929. se habet ad 34427. sicut se habet 34427. ad 39601. quia extremi dati numeri secum multiplicati, producunt 1185.218329. cujus radix quadrata est ut supra 34427. in tabulis.

§. 28. Porro etiam tertii proportionalis inventio per tabulas quadratorum facillima est, quia secundi termini quadratum divisum per primum terminum est quæsitus tertius terminus. Ex. gr. secundi termini dati, 6. quadratum est 36. quod per terminum primum 4. divisum efficit quotientem 9. quæsitum tertium terminum, similiter secundi termini, 34427. quadratum est 1185.218329. quod divisum per primum terminum 39601. efficit quotientem 29929. quæsitum tertium terminum.

§. 29. Sic facillè continua progressio geometrica fieri potest in infinitum, si tertio proportionali invento porro inveniat quartus, per secundum & tertium, & sic quarto invento deinceps quintus inveniat, per tertium & quartum & sic deinceps, semper quærendo duobus proximè antecedentibus tertium proportionalem quousque libuerit, libuerit. summam verò omnium terminorum compendiosè invenire licet, si divides secundum terminum per primum, ut habeas sic denominatorem proportionis, hoc est, secundum quam rationem, ex. gr. duplam, triplam &c. vel aliam qualemcumque, progressio facta sit; denominatore sic invento, porro dividenda est differentia inter maximum & minimum progressionis terminum, per dictum denominatorem unitate diminutum, quotiens maximò terminò auctus est quæ-

Vel etiam si à dicti dupli numeri trigonii unitate aucti quadrato subtrahatur idem duplum, cum proportione data & unitate aucta multiplicatum; Vel etiam, si datæ proportionis surdesolidum, (quod est quadrati quadratum cum radice, vel etiam quadratum cum cubo multiplicatum,) unitate diminutum dividatur per eandem proportionem unitate diminutam.

Surdesolidum quid?

Similiter duplum numeri trigonii, cujus radix trigonia est data proportio, si augeatur unitate, Cubò, quadrati quadrato, sive Zenſi Zensò, nec non surdesolidò, illud ipsum sic auctum, erit quæſitus maximus terminus sex proportionalium, minimum terminum habentium, maximum per quadratum proportionis datæ divisum & cum maximo multiplicatum, summam omnium terminorum efficientem; Sepositis jam aliis multis & variis modis eundem invenienti maximum terminum ejusdem tenoris, tantummodò illum modum adhuc subjiciam, quò proportionis datæ quadrati Cubus sive Cubi quadratum unitate diminutum & sic divisum per eandem proportionem unitate diminutam, est idem quæſitus maximus terminus.

Quoniam itaque in §. 32. maximus terminus trium terminorum erat proportionis datæ Cubus unitate diminutus & sic divisus per eandem proportionem unitate diminutam, videmus, quòd ipsius Cubi exponens etiam sit 3. Porro in §. 33. maximus terminus quatuor terminorum erat proportionis datæ Zens-Zens unitate diminutus, & per eandem proportionem unitate diminutam divisus, Zens-Zens verò similiter habet exponentem 4. cum numero terminorum coincidentem; Deinde in §. 34. maximus terminus quinque terminorum erat datæ proportionis surdesolidum unitate diminutum & per eandem proportionem unitate diminutam divisum, surdesolidi verò exponens, 5. adhuc coincidit cum numero terminorum, & tandem in §. 35. maximus terminus erat proportionis datæ Zens Cubus unitate diminutus & per eandem proportionem unitate diminutam divisus, ubi rursus Zens Cubi exponens, 6. idem est cum numero terminorum; Concludimus itaque universaliter, numerum terminorum esse, exponentem Cossicam, qui exponit proportionis datæ quantitatem Cossicam, quæ unitate diminuta & sic divisa per ipsam proportionem datam unitate diminutam exhibet quæsitum progressionis geometricæ maximum terminum, qui ipse etiam divisus per quadratum proportionis datæ, exhibet minimum ejusdem progressionis terminum, ita, quidem, ut hi extremi termini secum multiplicati producant summam omnium terminorum.

Idem Cubi-Zensum, si consideretur tanquam quadratum, erit ejus in tabulis radix quadrata exacte 9125. sed hæc ipsa radix debet considerari ut Cubus, nam Zens-Cubus habet exponentem 6. atque radice quadrata ex illo extracta, erit per dimidiationem exponens 3. denotans eubum, quare radix cubica erit extrahenda aut per imitationem extractionis radices surdesolidi dividendo nimirum Cubum per quantitatem habentem exponentem unitate minorem, Cubi exponente, aut per tabulas Cubicas, in quibus præcisè numeri 9125. radix cubica est 45. quasi-secundus terminus, vel radix Cubi-Zensica numeri 8303. 865628. Tabularum
usque circa
inventionem

S. 73. Sic occasione problematis à Clavia propofiti ha-
tenus circa inventionem quorumcunque & quocunque
mediorum proportionalium occupati fuimus & integram
de

de iis doctrinam absolvimus, invento primò mediò propor-
 tionali vel secundò terminò vel etiam denominatione pro-
 portionis, quibus inventis facile jam est invenire reliquos
 medios omnes, saltem continuè duobus inveniendò tertium
 proportionalem, vel etiam continuè multiplicandò ante-
 cedentem terminum cum denominatione proportionis, ad-
 eò ut sibi constet incomparabilis tabularum tetragoniarum
 usus in multiplicandis & dividendis continuè ratione nu-
 meris.

§. 74. Alia haud spernenda problemata proponit d. I. *Quomodo*
 Clavius, quorum sequentià adhuc tetragonometriae nostra
 sunt affinia, Regula enim nona proportionalitatis geome-
 trica docet, quomodo possimus, invenire tres numeros a-
 rithmetice proportionales, ita, ut bini habeant unum me-
 dium proportionalem, intellige numero effabilem vel ra-
 tionalem, juxta §. 8. cap. 4. nimirum sumendo tres numeros
 quoscunque, quorum secundus primi est quintuplum & ter-
 tius ejusdem primi septuplum, horum enim singulorum
 quadrata erunt in proportionè arithmetica & simul inter
 primum & secundum nec non inter secundum & tertium
 nec non inter primum & tertium ceter unus medius geo-
 metricè proportionalis & non solum inter illa quadrata,
 sed etiam horum aequè multiplicia per multiplicationem
 eorum, vel submultiplicia, id est per eorundem quamlibet
 divisionem; ubi porro admiratione dignum judicat Cla-
 vius, inventis ejusmodi tribus arithmetice proportionali-
 bus, quadratum medii geometrici inter primum & secun-
 dum arithmeticum, deinde quadratum medii arithmetici
 & denique quadratum medii geometrici esse in proportio-
 ne arithmetica. Dantur itaque per tabulas nostras multa
 millia exemplorum, quibus hæc doctrina Clavii ad examen
 deduci

Exemplum. deduci potest; Si enim cujuslibet radicis ex. gr. 176. assumas quintuplum nempe 880. & ejusdem septuplum nempe 1232. erunt harum trium radicum quadrata 30976. & 774400. & 1517824. in proportionem arithmetica, quia differentia inter primum & secundum 743424. est eadem, quæ inter secundum & tertium. Sed & multiplicando primum arithmeticum 30976. cum secundo 774400. habebis numerum quadratum 23987814400. cujus radix, 154880. est illorum medius proportionalis, sive etiam productum ex multiplicatione primi assumti 176. cum quintuplo ejusdem 880. prout rectè monet Clavius: Similiter multiplicando secundum arithmeticum 774400. cum tertio 1517824. habebis rursus numerum quadratum 1175402905600. cujus radix 1084160. sive etiam productum ex multiplicatione primi assumti 176. cum septuplo ejusdem nempe 1232. Porro quadratum medii inter primum & secundum arithmeticum nempe 23987814400. & quadratum secundi arithmetici 599695360000. nec non quadratum medii inter secundum & tertium arithmeticum nempe 1175402905600. sunt in arithmetica proportionem, quia inter primum & secundum quadratum differentia est 575707545600. quæ etiam est inter quadratum secundum & tertium; Si porro inventorum ab initio quadratorum assumas iisdem æquemultiplicia quælibet, multiplicando nimirum eadem singula per unum eundemque numerum; Vel etiam si eadem divides per aliquos numeros (poteris verò semper per illos numeros eorumque quadrata, qui dividunt primum numerum assumptum,) adhuc proportio existet arithmetica; Ex. gr. 11. dividit assumptum 176. quare etiam dividet non solum ipse, sed & ejus quadratum, singula inventa tria quadrata proportionalitatis arithmetica.

§. 75. In regula decima proportionalitatis Geometricæ *Quomodo tetragonometrix quiddam affine tradit Clavius, quod nimirum possint inveniri duo numeri inter quos cadant quotlibet medii geometricè proportionales integri & non fracti, si assumantur nimirum duo quilibet numeri proportionem datam habentes & uterque eorum toties continuè secum ipso multiplicetur, quot debent cadere medii proportionales numeri, unò adhuc insuper additò, producta enim erunt illi numeri, inter quos cadunt tot medii proportionales, quot requiruntur in data proportionem; Jam verò quomodo beneficio exponentium, brevissimè & facilimè per tabulas quadratorum supra sufficientissimè traditum est.*

§. 76. Concludimus tandem quidem cum Clavio proportionalitatem geometricam problemate : Numerum quemcunque datum distribuere in quotvis partes proportionales geometricè in data proportionem, sed multò compendiosius & artificiosius idem problema solvimus, ut sequitur ; Numerus, qui determinat, in quot partes datus numerus dividi debeat, esto exponens designans quantitatem coscicam datæ proportionis, quæ quantitas coscica unitate diminuta & divisa per datam proportionem unitate diminutam, datum numerum dividit per partem primam seu minimam, quâ inventâ & reliquæ omnes faciliè inveniuntur, si nimirum eadem pars minima continuè & totiescum data proportionem multiplicetur, in quot partes datus numerus dividi debet ; Hoc problema, quomodo illi quod in §. 31. propositum est affine sit & duplici solutione gaudeat, haud sine delectatione dijudicari poterit ex §. 37. & 38. atque ut hoc ed facilius fieri possit, proponimus exemplum ex §. 55. desumptum : Sit datus numerus 141214768140. qui dividendus est in 24. partes continuè proportionales & quidem in ratione tripla ;

T

triplica ;

Exemplum.

tripla; quapropter quantitas numeri 3. sub exponente 24. est ibidem 281429336481. quæ unitate diminuta & sic divisa per proportionem datam & unitate diminutam nimirum 141214768240. datum numerum dividit per 1. quæsitam nempe primam & minimam partem, quare secunda pars erit 3. tertia 9. quarta 27. &c. omnes verò tandem in unam summam collectæ efficient datum numerum 141214768240.

(2.) *Per inventionem partis cujuscunque intermedia, seu etiam maxima.*

§. 77. Si verò non primam seu minimam partem primò omnium sed aliam partem quamlibet vel intermediam vel maximam quæramus; tunc adhuc quidem datus numerus dividi debet, semper & universaliter per divisorem jam determinatum, sed datus numerus non aliter sic dividitur, nisi prius multiplicatus sit cum quantitate cossica proportionis datæ quæ habeat exponentem unitate minorem quam numerus est, qui determinat quæ pars sit omnium primò inveniendæ; Ex. gr. si quinta pars sit inveniendæ, datus numerus multiplicandus erit cum Zensi-Zenso proportionis datæ, quia exponens 4. designat Zensi-Zensum, & sic de cæteris, retentò semper communi divisore.

Usus tabularum in proportionibus Musica, seu harmonica. Definitio hujus.

§. 78. Ad proportionem musicam seu harmonicam progredimur, in qua neglectis illis, quæ per simplicem multiplicationem & divisionem peragi & ex Clavio peti possunt, alia quæ solum examinabimus, quorum cum quadratis numeris suum est commercium; Harmonica verò seu musica proportio est, quando tribus numeris propositis, differentia inter primum & secundum numerum se habet in ea ratione, ad differentiam inter secundum & tertium in qua ratione se habet primus numerus ad tertium.

Quomodo ex arithmetica proportionibus fiant tres harmonici numeri?

§. 79. Ex Arithmetica verò proportionibus trium terminorum gigni tres terminos harmonicæ proportionis, si primus terminus multiplicet secundum & tertium terminum,

nunt; nec non secundus tertium terminum arithmetice proportionis, ut ita ista tria multiplicationis producta sint tres numeri harmonicè proportionales, docet Clavius in Regula prima proportionalitatis harmonicæ;

§. 80. Sed nos absque ulla multiplicatione eosdem tres harmonicos terminos constituemus, si in tabulis quæramus medii arithmetice proportionis termini quadratum & ab illo quadrato subtrahamus quadratum differentię, seu excessus in ista proportionē arithmetica & habebimus tunc medium terminum harmonicum, ab hoc medio termino subtrahē porro quadratum primi termini arithmetice proportionis & residui dimidium, si addatur eidem quadrato primi termini, erit summa primus terminus harmonicus, si verò idē dimidium addatur dicto quadrato medii arithmetici & insuper eidem quadrato adhuc quadratum differentię, erit trium illorum summa tertius proportionis harmonicę terminus. E.g. Sint tres numeri arithmetice proportionales 10661. 10988. & 11315. quorum differentia est 327; quadratum medii termini est 120.736144. à quo subtractum differentię quadratum 106929. relinquit medium terminum harmonicum 12062925. si porro ab hoc medio subtrahatur quadratum primi termini 113. 656921. relinquitur 6972294. cujus dimidium 3486147. si addatur dicto quadrato primi termini, erit summa 117143068. primus terminus harmonicus, idē verò dimidium, si addatur dicto quadrato medii arithmetici & insuper quadratum dictę differentię erit summa horum trium 124329220. tertius harmonicus terminus. Similiter ex tribus arithmetice 2. 3. 4. sunt tres harmonici 6. 8. 12. nam medii quadratum est 9. & quadrato differentię diminutum 8. medius harmonicus, quadrato primi diminutus est 4. cujus dimidium 2, si addatur quadrato primi 4. habes

§. 81. Per numerum quadratum, solvit Clavius curiosissimum problema in Regula VII. proportionalitatis harmonicæ ad Euclidem. quod ita se habet: Sint inveniendi quinque numeri, in quibus omnes tres proportionalitates existunt, ita, ut primi tres numeri habeant proportionalitatem arithmeticam, relictis autem primis, tres insequentes proportionalitatem geometricam & tres postremi proportionalitatem harmonicam; efficietur autem hoc si constituentur tres termini in proportionalitate geometrica cujuslibet proportionis & repræsentabunt illi tres, quintum, tertium & primum terminum, constituto jam medio termino arithmetico inter quintum & tertium, jam adsunt omnes præter secundum, qui erit quadratum tertii termini, divisum per quartum terminum; & si aliqua fractio accesserit, problemati verò satisfieri debeat in numeris integris, reducendi sunt omnes quinque termini ad eandem denominationem, quæ neglecta numeratores erunt quæriti quinque numeri. Ex.gr. sint constituti quintus, tertius & primus terminus in proportionem geometricam 12. 6. & 3. inter 12. & 6. medius arithmeticus est 9. quartus terminus, qui dividit quadratum tertii 36. per 4. secundum terminum, sunt ergo hi quinque numeri 12. 9. 6. 4. 3. illi qui quærentur.

§. 82. Ad Tetragonometriam nostram omnino etiam trahi potest, quod Clavius proponit in Regula VIII. Harmonicæ proport: ad Eucl. Inveniendi sunt quatuor nume-

ri,

ri, quorum extremi habeant datam proportionem & qui
 constituent Harmoniam maximam, hoc est, ut ipsi sint Geo-
 metricè proportionales, quamvis non continuè sed saltem
 discretè, unus autem mediorum cum extremis seruet pro-
 portionalitatem arithmeticam, alter verò harmonicam.
 Solutio est talis: Assumi debent duo numeri quilibet ha-
 bentes datam proportionem, inter quos debet constitui
 medius arithmetice proportionalis (quod facile fit, cum
 semper sit dimidia summa extremorum) per hos tres arith-
 metice proportionales juxta §. 79. quarantur tres harmoni-
 ce proportionales, qui erunt tres termini, primus, secundus
 & quartus quæsit, tertius verò est medius arithmetice pro-
 portionalis inter primum terminum & quartum inventus.
 Sic ex, gr. duo numeri in dupla proportionem 1. & 2. habent
 medium arithmetice proportionalem $\frac{3}{2}$ ut ita sint per re-
 ductionem ad eandem denominationem, neglectâ denomi-
 natione, tres arithmetice proportionales 2. 3. 4. quia jam
 quadratum medii est 9. et si subtrahas ab hoc quadratum dif-
 ferentiæ 1. residuum erit medius harmonicè proportionalis,
 æquo si porro subtrahas quadratum primi termini 4. resi-
 duum erit 4. cujus dimidium 2. si addatur quadrato primi
 termini 4. summa 6. erit primus Harmonicus & si idem di-
 midium unâ cum quadrato differentiæ addatur dicto qua-
 drato medii arithmetici summa trium erit 12. tertius har-
 monicus terminus, hi verò tres termini sunt quatuor quæ-
 sitorum primus, secundus & quartus, tertius verò est medi-
 us arithmeticus inter primum & quartum 12. nimirum 9.
 quare hi quatuor numeri 6. 8. 9. 12. constituunt harmoniam
 maximam juxta definitionem quidem Clavii.
